TITLE: Outfit for observing and reporting amplitude characteristics of quadripoles

CITED SOURCE: Sb. Tekhn. kibernetika. Kiyev, Gostekhizdat USSR, 1963, 116-119

TOPIC TAGS: quadipole, curve plotter

TRANSLATION: The point-by-point measuring of amplitude characteristics of various computer elements (amplifiers, function generator, multiplication-division circuits, transistors, semiconductor diodes, etc.) results in large errors and requires much time. An outfit is described which permits obtaining quadipole amplitude characteristics automatically and recording them on chart paper with an error of 1% or less. The outfit comprises a variable-parameter sawtooth-voltage (SV) generator, a scale divider, and an indicating voltmeter. Recording is performed on EPP-09 potentiometer; observation, on an electron oscilloscope. The voltage SV divider is required for selecting the recording scale which is attained by varying the SV applied to the test quadipole. In the SV generator, the rate of voltage rise is attained by

Card 1/2

L-43935-65

ACCESSION NR: AR4046576

varying the time constant of the charge-discharge circuit and also by varying the input voltage. Both rising and falling SV's are recorded which permits determining the hysteresis properties of the quadripole. A principal circuit based on electron tubes is supplied. Bibliography: 2 titles.

TITLE: Extraction of Tellurium from Some Lead-Industry Products  
(Izvlecheniye tellura iz nekotorykh produktov svintsovogo  
proizvodstva)

PERIODICAL: Tsvetnyye Metally, 1957, Nr 10, pp.80-87 (USSR)

ABSTRACT: The authors describe results of work carried out at the Chimkent lead works with the object of finding the concentration of tellurium in various materials involved in lead production and of determining methods for its recovery. The concentrates received at the works have 0.005-0.700% Te and the distribution of the element in different products (Tables 1 and 2) showed that some contained increased concentrations, particularly alkali skimmings from the oxygen refining of bismuth. A method for recovering elementary tellurium from these is described; and it is shown that the element can also be recovered from slag from the melting of sodium antimonate. Details are given of two new spectroscopic methods developed for determining tellurium in lead (1-0.006%), bismuth (1-0.003%), tin(1-0.01%) and antimony (1-0.005%) and also in

TITLE: Extraction of Tellurium and Indium from Antimony Slags  
(Izvlecheniye tellura i indiya iz sur'myanistykh shlakov).

PERIODICAL: Tsvetnyye Metally, 1958, Nr.8, pp.34-39 (USSR)

ABSTRACT: The authors have previously shown (Ref.1) that at the Chimkent lead smelters the tellurium-content of the slag from re-smelting of sodium antimonate can reach 0.2-0.8%. Since these slags also contain indium the authors carried out work to determine the nature of the distribution of this element in the various products of the lead industry (Table 1) as a preliminary to the development of a process to recover it and tellurium. It was found that the indium tends to concentrate in the dry dross during de-coppering of crude lead. This dross, dusts from the shaft smelting of sinter or circulating materials or antimony slag could be used for indium recovery. The last material, obtained from a pilot-plant, was chosen, its composition being 9.6% Sb; 0.29% Pb, 0.05% Cu, 0.55% As, 0.65% Sn, 0.67% Fe, 0.99% Al,

Card 1/2

SOV/136-58-8-8/27

Extraction of Tellurium and Indium from Antimony Slags.

1.4% S (total), 0.5% S (sulphide), 5.64% SiO<sub>2</sub>, 10.87% NaOH, 54.65% Na<sub>2</sub>CO<sub>3</sub>, 0.3-0.9% Te, 0.01-0.02% In. It was found that tellurium and indium stay in the solid residue (Table 2). After a sulphatizing roast at 250-300°C the indium can be leached out by water at 85-90°C but the tellurium is practically insoluble. Based on this a flowsheet (Fig.) has been devised which gives elementary tellurium (by caustic-soda leaching of the insoluble residue from the indium leaching, followed by electrolysis) and an indium concentrate from which metallic indium can be obtained. There is 1 figure, 5 tables and 4 Soviet references.

TITLE: Behavior of Cadmium During Fuming of Slags (Povedeniye kadmiya pri f'umingovanii shlakov)

PERIODICAL: Tr. i materialy. Ural'skiy n.-i. i proyektn. in-t medn. prom-sti, 1957, Nr 2, pp 361-364

ABSTRACT: An analysis of the behavior of Cd in the process of fumigation of Zn slags shows that practically 100% of the Cd are driven off within the first few minutes of slag blowing. The extraction of Cd into sublimates reaches the value of  $\sim 100\%$ . Thus, at the Flin-Flon plant the content of Cd in the initial and in the waste slags amounts to 0.0036% and 0.0008% respectively, while the Cd content in sublimates constitutes 0.066%. The extraction of Cd into the sublimates constitutes 80%, and in excess of 100% when taken in terms of the Cd driven off into the sublimates. 1. Cadmium--Separation 2. Zinc ores--Processing 3. Title : Study of the Action of Largactil on Rabbits after Seizures Induced by Electric Current or Cardiazol

Orig Pub : S"vrem. med., 1958, 9, No 3, 23-27

Abstract : It was shown that Largactil (L), alongside with a hypnotic effect, also exerts an epileptogenic action. Intravenous administration of 5 mg/kg of 2% solution of L to rabbits after ten electroconvulsive seizures produces tonic and clonic spasms followed by a phase of sleep. 18-100 minutes after the cessation of electrically induced convulsive seizures, the epileptogenic effect of L disappears. -- From the authors' summary

TITLE: Absorption of sulfur dioxide in water and aqueous solutions of surface-active agents

SOURCE: Bulgarska akademiya na naukite. Doklady, v. 18, no. 12, 1965, 1141-1144

TOPIC TAGS: gas absorption, surface active agent, sulfur compound, chemical laboratory apparatus, water, aqueous solution

ABSTRACT: The present paper reports on the absorption of sulfur dioxide in water and aqueous solutions of surface-active agents in a nozzleless Venturi tube with a slant feeding of the absorbent. The purpose was to investigate the course of absorption of a medium-soluble gas in this type of absorber and to check the effect of admixtures with surface-active behavior on the mass exchange. Investigations were carried out in the regions  $Re = 1.44 + 3.27 \cdot 10^4$ ; gas velocity in absorber neck - 40 to 120 m/sec; relative consumption -  $0.6-6.0 \cdot 10^{-3} \text{ m}^3/\text{m}^3$  of gas with bulk concentrations of sulfur dioxide - 0.67, 1.96, 4.62, and 6.79 per cent; water and  $10^{-3}$ ,  $10^{-2}$ ,  $10^{-1}$  aqueous solutions of Nekal BX. Results are presented in the form of graphs and a table. The article concludes with the establishment of several empirical formulas. This paper was presented by Academician D. Ivanov on 17 September 1965. Orig. art. has: 3 figures, 2 formulas and 1 table. [Orig. art. in Eng.] JPRS; 36, 4647

AUTHOR: Boyanjieva, A.; Hadjiolov, D.ORG: Institute of Morphology, BANTITLE: Histological and ultrastructural changes in the liver of rats fed 3'-methyl-  
4-dimethylaminoazobenzene

SOURCE: Bulgarska akademiya na naukite. Doklady, v. 18, no. 11, 1965, 1055-1058

TOPIC TAGS: rat, liver, histology, drug effect, tumor, organic azo compound, cytology,  
cytoplasm

ABSTRACT: A number of cancerogenic substances such as azo-dyes, nitrosamines, and aminofluorenes cause centrolobular parenchymal degeneration in the liver. However, the effect of large doses of azo-dyes or nitrosamines on the liver cell, followed in brief periods of time, can differ essentially from the conditions which occur upon receiving continuously small doses of the same carcinogens. The present work investigated the effect of continuous feeding of 3'-methyl-4-dimethylaminoazobenzene (3-Me-4-DAB) on the ultrastructure of the liver cell of male albino rats. Liver slices taken on the 30th, 60th, and 90th days after the start of the experiment were subjected to histological investigation using an electron microscope. The article contains a detailed description of the findings. It is emphasized that under the conditions of chronic intoxication with azo-dyes there is a marked simultaneous injury to the entire cytoplasm: endoplasmatic reticulum, ribosomes, and

Card 1/2

TITLE: Production of  $\Lambda(\Sigma^0)$  hyperons and  $K^0$  mesons in interaction between 7 GeV negative pions and carbon

SOURCE: Zh. eksper. i teor. fiz., v. 46, no. 5, 1964, 1586-1597

TOPIC TAGS:  $\Lambda$  hyperon,  $\Sigma^0$  hyperon, neutral kaon, negative pion carbon interaction, hyperon production, kaon production, pion proton interaction, bubble chamber, secondary interaction fraction, angular distribution, momentum distribution, cascade model

ABSTRACT: The production of  $\Lambda(\Sigma^0)$  hyperons and  $K^0$  mesons by negative pions on carbon was investigated and compared with earlier results

Card 1/6

ACCESSION NR: AP4037568

(ZhETF v. 40, 464, 1961) from  $\pi^- p$  interactions at the same pion momentum. A 24-liter propane bubble chamber in a constant field of 13,700 Oe was used in accordance with a procedure described before (ZhETF, v. 38, 426, 1960). The purpose of the experiment was to estimate the fraction of the secondary interactions. An estimate was made for the first time of the fraction of strange particles produced in the secondary processes. The momentum spectrum of the  $\Lambda$  hyperons (in the pion-nucleon center of mass system) was compared with the spectrum for the  $\pi^- p$  interactions. The following distribution of events over the reaction channels was obtained

	$Y^0 K^0$	$Y^0 K^+$	$K^0 \bar{K}^0$	$K^0 K^- + K^+ \bar{K}^0$	$\Sigma^0 \bar{\Lambda}^0$	$Y^0 Y^0 K K$
Number of events	$427 \pm 60$	$223 \pm 81$	$147 \pm 52$	$323 \pm 127$	$80 \pm 31^{(1)}$	40
Cross section, mb	$4.8 \pm 0.8$	$2.5 \pm 0.9$	$1.7 \pm 0.6$	$3.6 \pm 1.4$	$0.0 \pm 0.4$	0.04

and the cross section for each interaction event with the carbon was calculated to be 0.0113 mb. This yielded the following cross

Card 2/6

ACCESSION NR: AP4037568

sections

$$\sigma(Y^0\Lambda^{+0}) = 7.3 \pm 1.2 \quad \text{and} \quad \sigma(K^0\bar{\Lambda}) = 5.3 \pm 1.5$$

The good agreement between the calculated and experimental values of the spectra of the  $\Lambda$  hyperons and  $K^0$  mesons gives grounds for assuming that the cascade model holds true for these phenomena. It also is concluded that the previously observed hard part of the momentum spectrum of the  $\Lambda$  hyperons in the pion-nucleon center of mass system in  $\pi^- p$  interactions is due to an admixture of carbon events, and that the role of the secondary processes which lead to the production of strange particles is quite appreciable even on the carbon nucleus. "The authors are grateful to I. Klugov and M. Shneyeberger for help at the beginning of the work, to V. S. Barashenkov, I. V. Chuvilo, and M. I. Podgoretskiy for discussion and valuable remarks, to Ye. P. Zhidkov, G. A. Ososkov, and K. N. Danilova for help with the calculations, and to the laboratory group for the measurements." Orig.

"Changes in the Anthropometric and Hemodynamic Indices of Aged and Old  
People Under the Effect of Functional Loading with Physical Exercises"

Sofia, Eksperimentalna Meditsina i Morfologiya, Vol 5, No 2, pp 114-118

Abstract: The anthropometric, physiological, and hemodynamic indices of persons with an average age of 75 yrs who exercised and participated in sports were compared with those of a control group of people of the same age who did not exercise systematically. The people who exercised systematically were divided into two subgroups, those who exercised regularly and those who did not exercise regularly, while the people in the control group were divided into a subgroup of active people and another of passive people. The comparison showed that beneficial changes took place in the group that exercised and that these changes were more pronounced for the subgroup that exercised regularly.
